

New YieldGard® Plus -- Now Available

Producers now have a new tool to help in combating two of the most economically devastating insects that affect corn production. Corn borer and corn rootworm pests cause more economic damage combined than any other insects for corn producers.

The Environmental Protection Agency (EPA) recently granted registration for the stack of Monsanto's YieldGard® Corn Borer and YieldGard® Rootworm technologies. This new stacked technology is referred to as **YieldGard® Plus** and will allow the corn grower to eliminate the need to use insecticides to control these pests. This offers the grower significant advantage in terms of effectiveness, safety and convenience.

Now that individual state approvals have been granted Kaup Seed is offering for sale four hybrids for 2004:

- 97-1104YGPL (YieldGard® Plus version of 97-109BT)
- 97-1144YGPL (YieldGard® Plus version of 97-1133)
- 97-1154YGPL (YieldGard® Plus version of 97-1152BT)
- 97-1174YGPL (YieldGard® Plus version of 97-1164YGRW)

At Kaup Seed we remind growers that with these products there are refuge and grain channeling requirements that must be adhered to when using these products.

Should you have interest or further questions about this exciting new technology or hybrids Kaup Seed is offering please feel free to contact us at info@kaupseed.com
